## Determining Intercepts

## by Sophia

## WHAT'S COVERED

In this lesson, you will learn how to determine the $x$-intercept and $y$-intercept of a linear equation. Specifically, this lesson will cover:

## 1. Determining Intercepts on a Graph

When we talk about a line's intercepts, we most often mean thex-intercept and the $y$-intercept. These are locations where the line intercepts or crosses the $x$ - or $y$ - axis. A Below is the graph of a line, with both intercepts shown:

## $\star$ BIG IDEA

Notice that the x-intercept always has a y-coordinate of 0 , and the $y$-intercept always has an $x$-coordinate of 0 .

## 目 TERMS TO KNOW

## x-intercept

Where a line or curve intersects the x -axis, at $y=0$.
y-intercept
Where a line or curve intersects the $y$-axis, at ${ }^{x}=0$.

## 2. Determining Intercepts from a Table

Keeping the above note in mind, we can easily identify intercepts from a table of $x$ and $y$ values when we notice that one of the coordinates is zero!
$\rightarrow$ EXAMPLE Find the x-intercept and y-intercept for the list of values in the following table.

| $x$ | $y$ |
| :---: | :---: |
| -2 | 18 |
| 0 | 12 |
| 2 | 6 |
| 4 | 0 |
| 6 | -6 |

We see that a coordinate pair $(0,12)$ contains a zero. In this coordinate pair, the x-coordinate is zero, which means this actually represents the y-intercept. The $y$-intercept of the line is at the point $(0,12)$.

We also notice a zero in the coordinate pair (4, 0). In this case, the y-coordinate is zero, so this is the $x$ intercept. The line crosses the $x$-axis at the point $(4,0)$.

## 3. Determining Intercepts from an Equation

How can we use the equation of a line to find its $x$ - and $y$ - intercepts? A common form of a line is in slopeintercept form: $y=m x+b$. This form is called slope-intercept form because b represents the $y$-coordinate of the $y$-intercept (and we know that its $x$-coordinate is 0 ). We can also use the equation in this form to find the $x$ intercept. Since $x$-intercepts have a $y$-coordinate of 0 , we set the equation equal to zero and solve for $x$.
$\rightarrow$ EXAMPLE Find the $x$-intercept and $y$-intercept of the equation $y=-2 x+8$.

We can easily find the $y$-intercept:

$$
\begin{array}{ll}
y=-2 x+8 & \begin{array}{l}
\text { When we have the equation in the form } y=m x+b \\
\text { coordinate of the y-intercept }
\end{array} \\
b=8 & \begin{array}{l}
\text { This is the } y \text {-coordinate of the } y \text {-intercept. For the } y \text {-intercept, the } \mathrm{x} \text { - } \\
\text { coordinate is always } 0
\end{array} \\
y \text {-intercept }=(0,8) & \text { The y-intercept is }(0,8)
\end{array}
$$

Now, find the x-intercept:

$$
\begin{array}{ll}
y=-2 x+8 & \text { To find the } x \text {-intercept, plug } 0 \text { in for } y \text { as the } y \text {-coordinate is always } 0 \\
0=-2 x+8 & \text { Subtract } 8 \text { from both sides }
\end{array}
$$

$$
\begin{array}{ll}
-8=-2 x & \text { Divide both sides by }-2 \\
4=x & \begin{array}{l}
\text { This is the } x \text {-coordinate of the } x \text {-intercept. For the } x \text {-intercept, the } y \text { - } \\
\text { coordinate is always } 0
\end{array} \\
x \text {-intercept }=(4,0) & \text { The } x \text {-intercept is }(4,0)
\end{array}
$$

For the equation $y=-2 x+8$, the $x$-intercept is at $(4,0)$ and the $y$-intercept is at $(0,8)$.

## SUMMARY

When determining intercepts on a graph, the x -intercept is where a line or a curve intersects the x axis. It is also where $y$ equals 0 and is written as $(x, 0)$ as a coordinate pair. The y-intercept is where a line or curve intersects the $y$-axis. It is also where $x$ equals 0 and is written as $(0, y)$ as a coordinate pair. When determining intercepts from a table, we look for instances where $x$ equals 0 or $y$ equals 0 . When determining intercepts from an equation, the variable $b$ represents the $y$-coordinate of the $y$ intercept. To find the $x$-intercept, plug in 0 for $y$ and solve for $x$.

## TERMS TO KNOW

## x-intercept

The location on a graph where a line or curve intersects the x -axis: $(\mathrm{x}, 0)$

## y-intercept

The location on a graph where a line or curve intersects the $y$-axis: $(0, y)$
